# Struttura e Meccanismo d'azione

## Eparina standard (UFH) vs Eparina a basso peso molecolare (LMWH)

# LMWH

Fernández Pavón A. Emergencias 2002; 14 (3): 38-47

Davenport A et al. Nephrology 2009; 14: 455-461

Le varie eparine a basso peso molecolare sono preparate in base a differenti metodi di depolimerizzazione, per cui differiscono nelle rispettive proprietà farmacocinetiche e anticoagulanti. Per questo motivo non sono interscambiabili clinicamente.

# Farmacocinetica (I): Clearance

1. Basse dosi di UFH vengono metabolizzate rapidamente attraverso un meccanismo rapido cellulare saturabile
2. Alte dosi di eparina sono metabolizzate prevalentemente attraverso un meccanismo di clearance renale non saturabile

# Farmacocinetica (II)

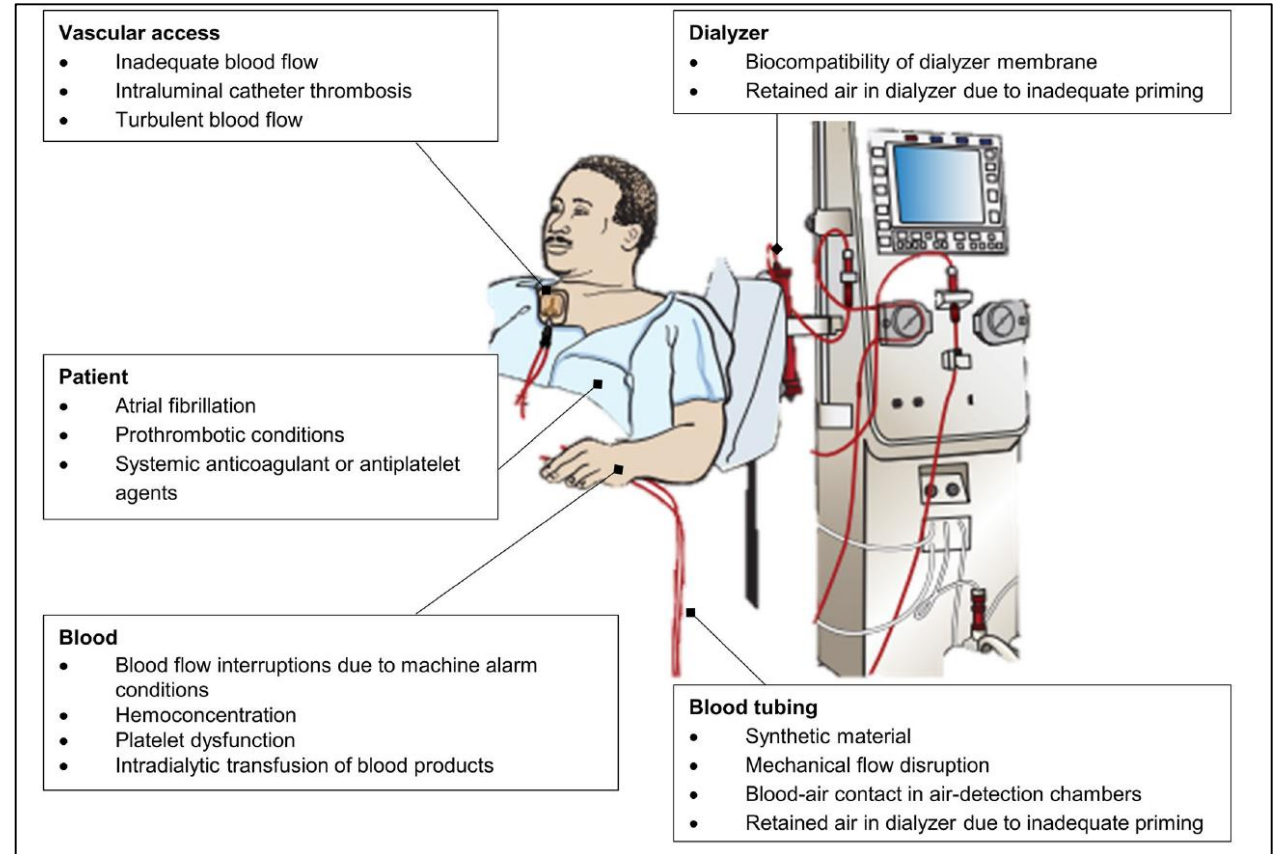

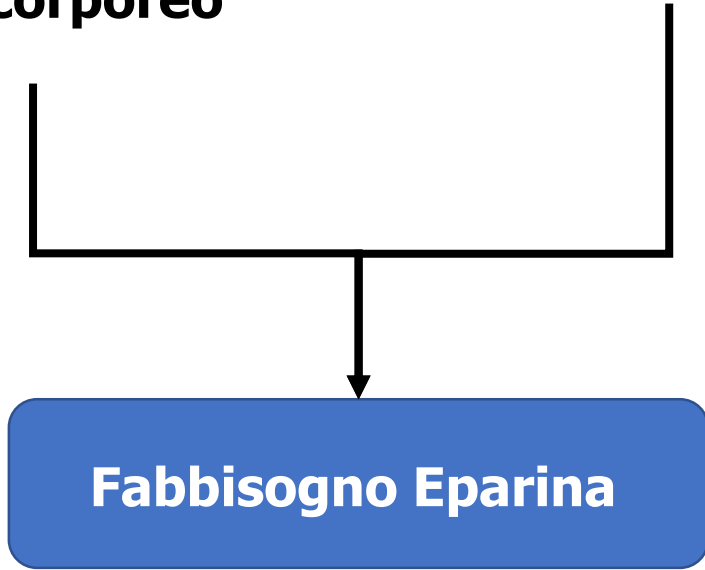

**Le eparine a basso peso molecolare, avendo una catena polisaccaridica di piccole dimensioni, interagiscono in misura ridotta con il sistema macrofagico e reticolo-endoteliale per cui la loro clearance è eminentemente renale**

**Anche le eparine standard, quando utilizzate a dosaggi elevati, saturando la “clearance cellulare”, sono eliminate in maggior proporzione grazie alla “clearance renale” aumentando teoricamente il rischio di sovradosaggio nei pazienti con ridotta funzione renale**

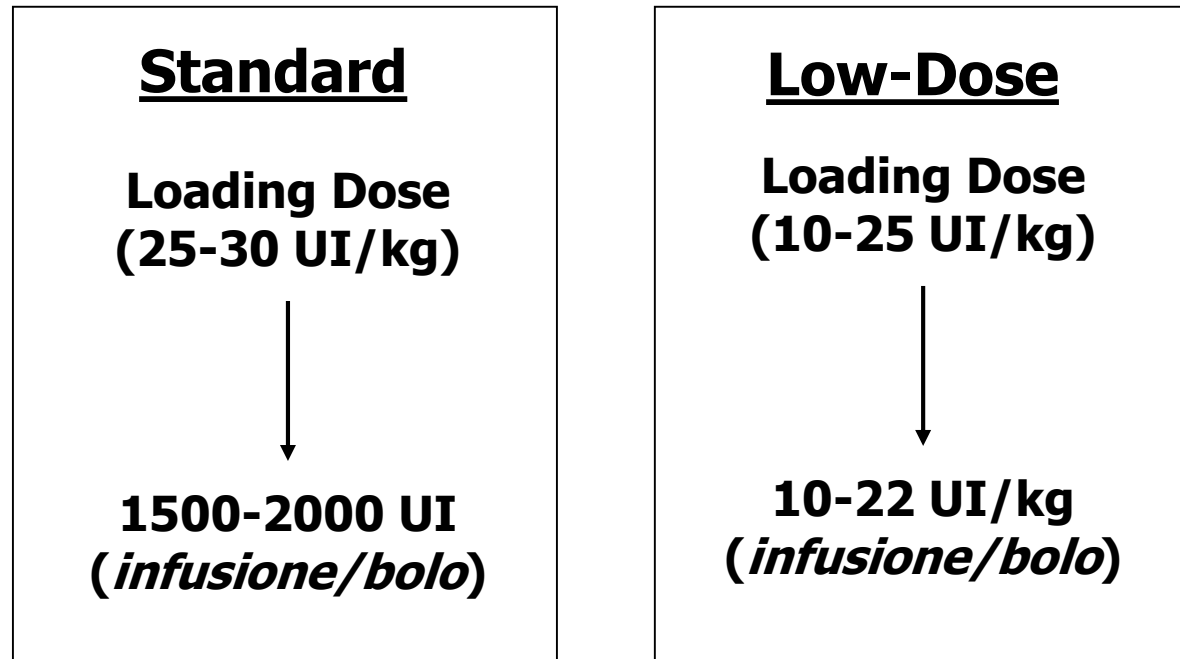

# Variabili del Fabbisogno Eparinico

**Circuito  
Extracorporeo**

**Paziente**

# Anticoagulazione con Eparina non frazionata (UFH)

# Anticoagulazione con Eparina non frazionata (UFH): Modifiche prescritzionali

Evento	Prescrizione
A. Coagulo nel pozzetto venoso e nella testata del filtro durante la prima metà della dialisi	• <b>AUMENTARE</b> il bolo di UFH con incrementi di 500 UI per trattamento, per un massimo di 4000 UI
B. Coagulo viene rilevato durante la seconda metà della dialisi	• <b>AUMENTARE</b> la velocità di infusione di UFH di 100 UI/h per ogni dialisi fino ad un massimo di 1000 UI/h
C. Coagulazione del filtro persiste nonostante un'appropriata titolazione dell'eparina	• <b>VALUTARE</b> l'accesso vascolare
D. Emorragia dai siti di puntura al termine della seduta dialitica	• <b>ALLUNGARE</b> il tempo di Pre-STOP dell'eparina con incrementi di 10 minuti fino a quando il tempo di emorragia si normalizza • <b>VALUTARE</b> l'accesso vascolare

LMWH	MWs (kDa)	Anti-Xa/ Anti-IIa	Dose for hemodialysis
Deltaeparin	6.0	2.7	5000 IU
Enoxaparin	4.2	3.8	1 mg/Kg
Nadroparin	4.5	3.6	70 IU/Kg
Reviparin	4.0	3.5	85 IU/Kg
Tinzaparin	4.0	1.9	4500 IU

Davenport A et al. Nephrology 2009; 14: 455-461

## Comparison of the injection of low-molecular weight heparin in the arterial vs. venous blood line for preventing extracorporeal circuit clotting during hemodialysis

LMWH 40 mg (4000 IU)		OL-HDF (n=12)	MCO-HD (n=13)	HF-HD (=18)	p	LMWH 20 mg (2000 IU)		OL-HDF (n=12)	MCO-HD (n=13)	HF-HD (=18)	p
Arterial line	Post dialysis AntiXa activity (IU/mL)	<b>0.14</b> <b>(0.1-0.35)</b>	0.33 (0.1-0.6)	0.32 (0.15-0.49)	0.02	Arterial line	Post dialysis AntiXa activity (IU/mL)	0.1 (0.1-0.15)	0.1 (0.1-0.17)	0.1 (0.1-0.33)	NS
Venous line	Post dialysis AntiXa activity (IU/mL)	0.31 (0.20-0.55)	0.39 (0.21-1.3)	0.4 (0.32-0.67)	NS	Venous line	Post dialysis AntiXa activity (IU/mL)	0.1 (0.1-0.14)	0.16 (0.14-0.24)	0.17 (0.1-0.47)	NS

LMWH 20 and 40 mg	Arterial line bolus	Venous line Bolus after 1 week	Venous line Bolus after 1 month	p
Ultrafiltration (L) (n=31)	2.7 (1.4-4)	2.6 (1.5-4)	2.5 (0.6-4)	NS
Substitution volume (L) (n= 12)	19.3 ± 4.5	22 ± 2.9	21 ± 3.5	NS
Compression time (min) (n = 12)	7 ± 4	9 ± 3	8 ± 2.9	NS

When LMWH were first introduced, anti-Xa activity targets were higher than 0.4–0.6 IU/mL,<sup>12</sup> although in current clinical practice lower targets are advisable, 0.2–0.4 IU/mL,<sup>13</sup> particularly in patients with increased risk for haemorrhage.

Davenport A et al. Nephrology 2009

# LMWH e Protamina

	Enoxaparin	Tinzaparin
Average MWt (Da)	4200	4500
Clearance	Mostly renal some hepatic	Renal with additional endothelial
Half-life (h)	24	5
Dose	0.5–1.0 mg/kg	2500–4500 IU
Ratio Xa/IIa activity	3.8	1.9
Protamine reversal	0.5 mg per 1 mg <60% reversibility	1 mg per 100 anti-Xa IU 85% reversibility
Other options	rH-Factor VIIa	

Davenport A et al. Nephrology 2009

The following approach is recommended in clinical situations where the anticoagulant effect of LMWH needs to be neutralized. If LMWH was given within 8 h, protamine sulfate should be administered in a dose of 1mg per 100 anti-Xa units of LMWH (1 mg enoxaparin equals approximately 100 anti-Xa units). A second dose of 0.5 mg protamine sulfate per 100 anti-Xa units should be administered if bleeding continues. Smaller doses of protamine sulfate can be given if the time since LMWH administration is longer than 8 h.

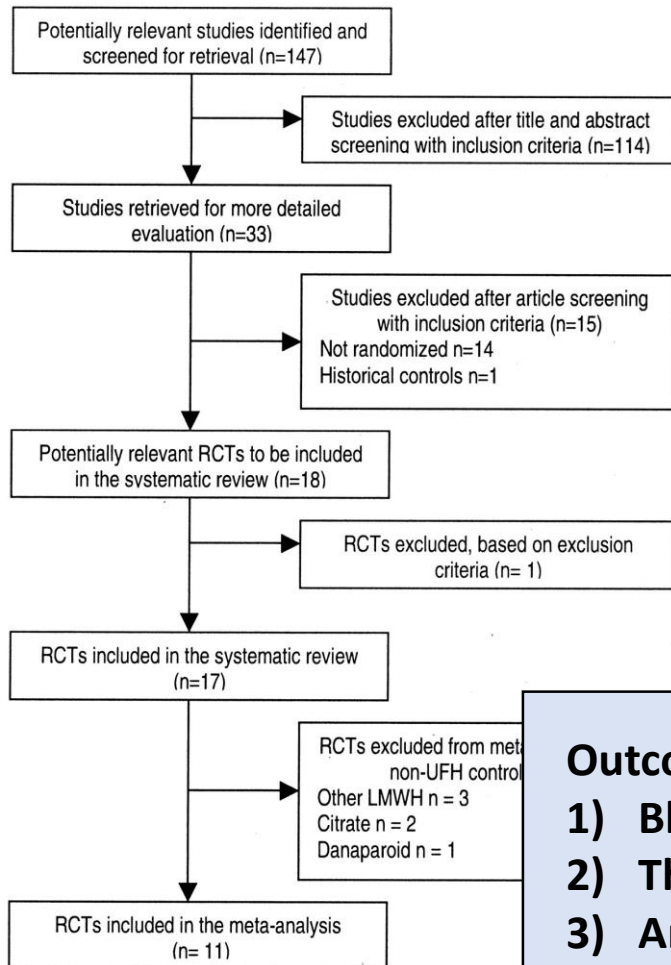

## Parenteral Anticoagulants\*

**Outcomes measured:**

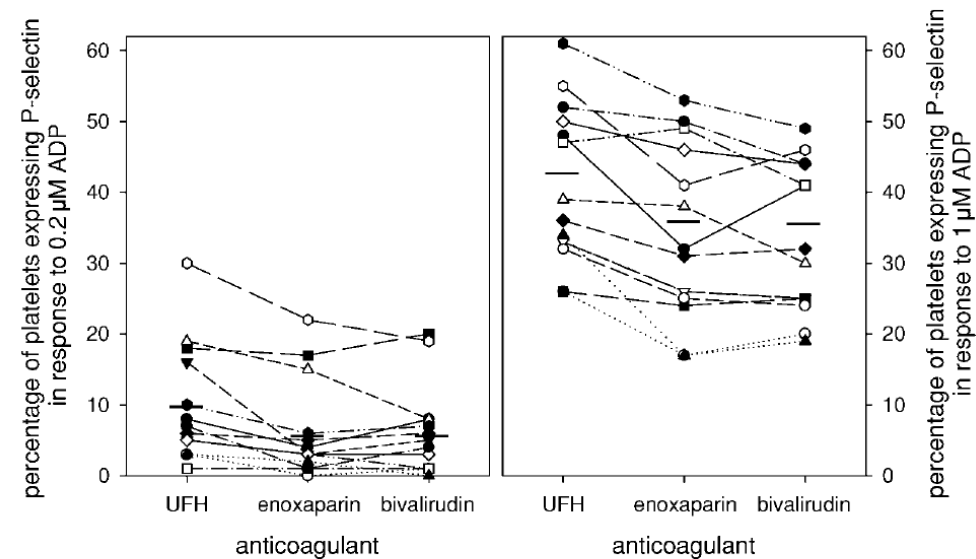

- 1) Bleeding
- 2) Thrombosis
- 3) Anti Xa levels

## Bleeding Risk

# Decreased Platelet Reactivity in Blood Anticoagulated with Bivalirudin or Enoxaparin Compared with Unfractionated Heparin: Implications for Coronary Intervention

- Patients (n): 13 affected by coronary artery disease
- Platelet reactivity:
  - Expression of P-selectin in response to adenosine diphosphate (ADP: 0.2 and 1  $\mu$ M).

*Fig. 1. P-selectin expression in response to 0.2  $\mu$ M ADP (left) and 1  $\mu$ M ADP (right). Each group of three symbols connected by a line represents values obtained from each subject. The bar depicts the average percentage of platelets expressing P-selectin. Despite inter-individual variability, anticoagulation with enoxaparin and bivalirudin is associated with lower platelet reactivity than anticoagulation with UFH ( $p < 0.01$  for either bivalirudin or enoxaparin compared with UFH). ADP = adenosine diphosphate, UFH=unfractionated heparin.*

# Risk for heparin-induced thrombocytopenia with unfractionated and low-molecular-weight heparin thromboprophylaxis: a meta-analysis

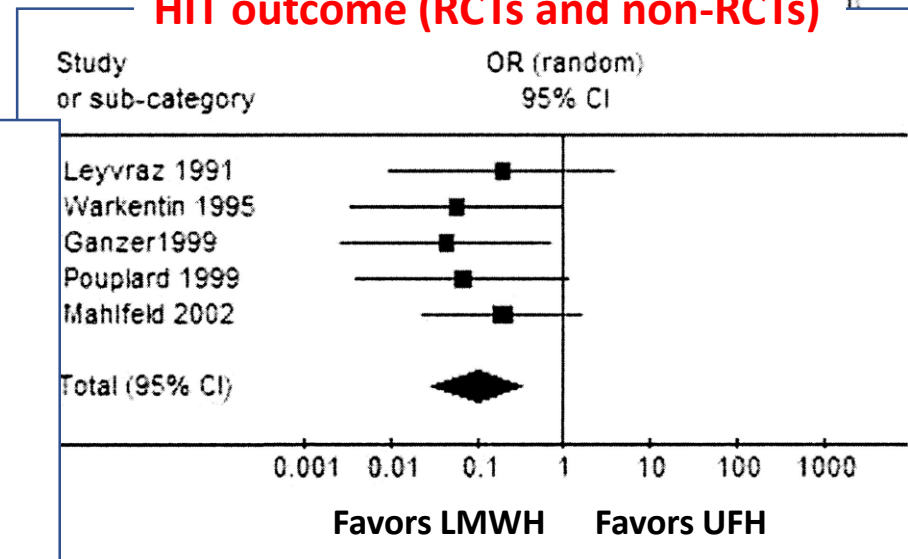

## Reports included (n) = 15

- 2 RCTs measuring HIT, patients (n) = 1014
- 3 Non-RCTs measuring HIT, patients (n) = 1464
- 10 RCTs measuring thrombocytopenia but not HIT, patients (n) = 4809

### HIT outcome (RCTs)

### HIT outcome (RCTs and non-RCTs)

### Thrombocytopenia

# Anticoagulazione in Emodialisi

## Guideline V.2.1:

### Low-dose of UFH or LMWH

1. UFH: loading dose ~ 50 IU/Kg followed by a continuous infusion 800-1500 IU/h.
2. LMWH: see I.F.U.; reduced dose if antiplatelets or antivitamin K

## Guideline V.2.2:

### LMWHs over UFH due to Proven safety

1. Equal efficacy
2. Easy handling
3. Other benefits of LMWHs:
  - a) Improved lipid profile
  - b) Less hyperkalaemia
  - c) Less blood loss

## Guideline 7.1: UFH or LMWH

### UFH = standard AC

- a) loading dose (unspecified) followed by a continuous infusion of 500-1500 IU/h
- b) discontinued ~ 30 minutes before the end of the session

### LMWH = alternative AC

- a) lower risk of bleeding
- b) less frequent hyperkalaemia
- c) improved lipid profile

# Rischio SANGUINAMENTO >> Rischio COAGULAZIONE

# Evaluation of Three Different Methods to Prevent Dialyzer Clotting Without Causing Systemic Anticoagulation Effect

Pavlina Richtrova, Kamila Rulcova, Jan Mares,  
and Tomas Reischig

Department of Internal Medicine I, Charles  
University, Medical School and Teaching Hospital  
Plzen, Czech Republic

## Anticoagulation methods

- 1 Regular saline flushes of ECC.** A polysulfone hemodialyzer F60(S) (Fresenius Medical Care, Bad Homburg, Germany) was used. During IHD, saline flushes with 250 mL were carried out every 20 min and the BF was 250 mL/min.
- 2 RCA.** The same F60(S) dialyzer was used. The acid citrate dextrose-A (ACD-A) solution with 2.2% trisodium citrate was infused at the beginning of the ECC at a rate of 300 mL/h (36 mmol/h). After 20 min and then every 60 min, this flow rate was adjusted based on ionized calcium ( $iCa^{2+}$ ) values at the dialyzer outlet with a target range of 0.25–0.35 mmol/L. The effect of citrate was reversed by infusion of calcium gluconic 10% before returning the blood to the systemic circulation. The flow rate of calcium was set according to the baseline value of systemic  $iCa^{2+}$  (median 9 mmol/h). The BF was 250 mL/min and the dialysis solution contained no calcium (Mg concentration was 0.5 mmol/L).
- 3 AN69 ST.** A Nephral ST 300 dialyzer (Gambro Hospital Industrie, Meyzieu, France) with AN69 ST membrane was used. The ECC was primed according to the manufacturer's recommendations with heparinized saline. The BF was 250 mL/min and the dialysis solution was identical as for saline flushes.

**FIG. 1.** Successful completion of hemodialysis procedures.

Mean transmembrane pressure, mmHg	23.5±20	24.2±21
Mean blood flow rate, mL/min	340±26	344±23

**Successful study period = no circuit-clotting event leading to premature interruption of any of the 4 dialysis sessions**

## A noninferiority trial comparing a heparin-grafted membrane plus citrate-containing dialysate versus regional citrate anticoagulation: results of the CiTED study

Björn Meijers<sup>1,2</sup>, Christoph Metalidis<sup>2,3</sup>, Thomas Vanhove<sup>1</sup>, Ruben Poesen<sup>1</sup>, Dirk Kuypers<sup>1,2</sup> and Pieter Evenepoel<sup>1,2</sup>

<sup>1</sup>Department of Microbiology and Immunology, KU Leuven, Leuven, Belgium, <sup>2</sup>Division of Nephrology, UZ Leuven, Leuven, Belgium and <sup>3</sup>Nephrology Unit, ZOL, Genk, Belgium

**The combination of heparin grafted membrane and citrate containing dialysate**

versus

**Regional citrate anticoagulation**

A hypertonic sterile solution of trisodium citrate dihydrate was infused into the afferent blood line at a rate 60mL/h using a separate infusion pump. The anticoagulant effect of citrate was neutralized using calcium-containing dialysate with a calcium concentration of 1.5 mmol/L.

In all sessions, a polyarylethersulfone dialyser (Polyflux® 170H, Gambro Dialysatoren, Hechingen, Germany) was used, with an effective membrane surface area of 1.7 m<sup>2</sup>

Citrate-containing dialysate was produced using Selectbag® Citrate 1/200 A concentrate (Gambro Dasco, Sondalo, Italy). We used the Evodial 1.6 (Gambro Industries) with an effective membrane surface area of 1.65 m<sup>2</sup>. This device is a precoated heparin-grafted membrane.

# Take home messages

1. UFH e LMWH sono sovrapponibili come efficacia nell'anticoagulazione del circuito extracorporeo
2. Il rischio di attivazione piastrinica e di HIT è maggiore con l'eparina non frazionata
3. La dialisi senza eparina è un'opzione indispensabile in qualsiasi contesto clinico «acuto»
4. La dialisi senza eparina più efficiente sembra la combinazione di membrane speciali con un dialisato a basso contenuto di citrato

# Chimica e Rugosità delle Membrane

Yamashita AC et al. Updates in Hemodialysis, 2015

Sunohara T & Masuda T. Contrib Nephrol. 2017; 189: 215–221

# Categorie di Rischio per Emorragia

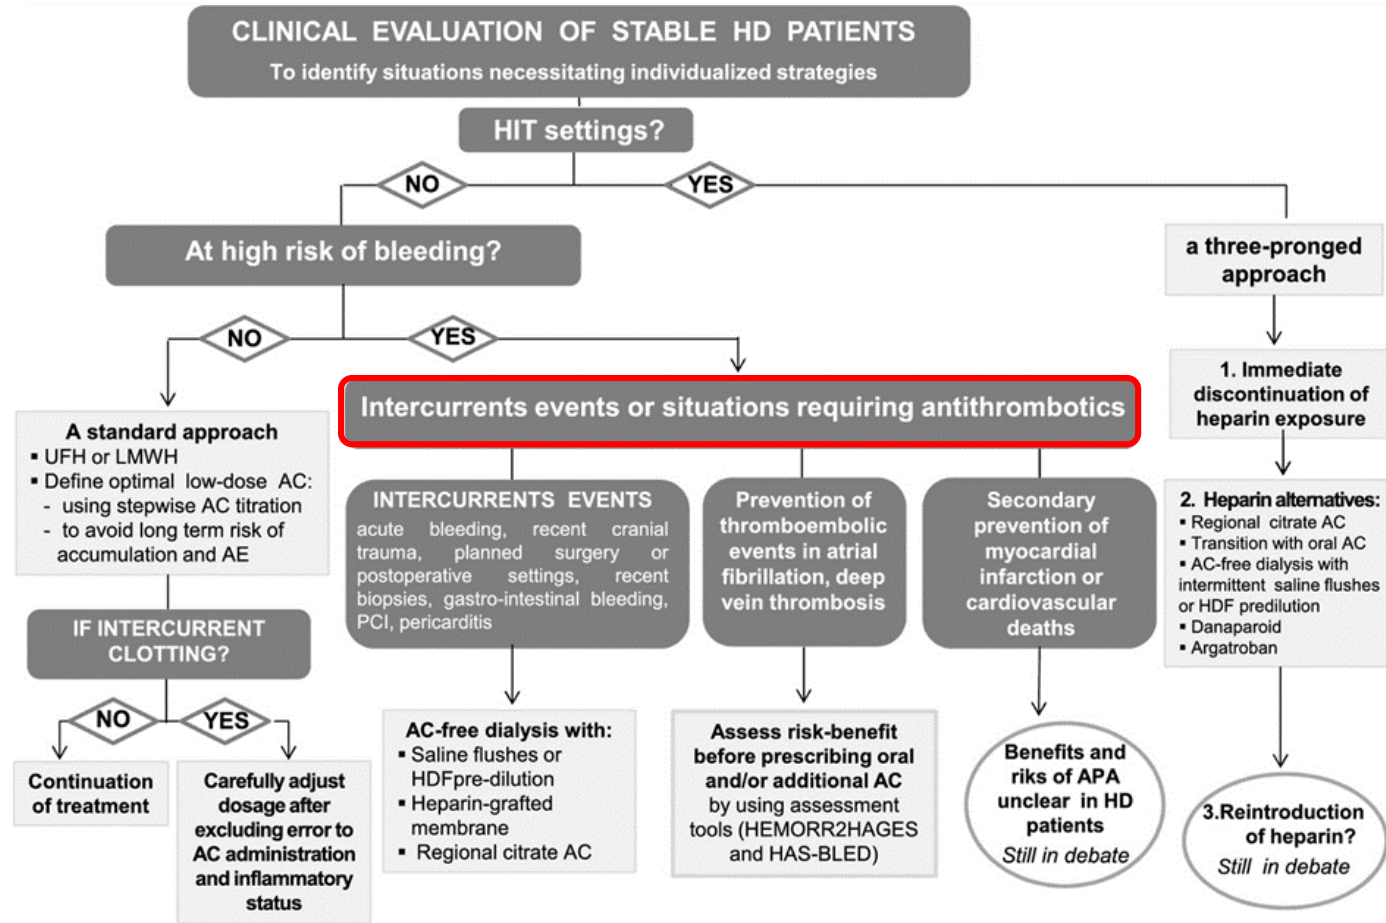

## Rischio Medio

- Pericardite
- Emorragia < 48 h
- Posizionamento CVC  
tunnellizzato < 24 h
- Chirurgia minore < 72 h
- Chirurgia maggiore o  
oculistica 3-7 gg

## Rischio Alto

- Sindrome emorragica
- Coagulopatia
- Emorragia cerebrale  
< 7 gg
- Ferita sanguinante
- Chirurgia maggiore o  
oculistica < 72 h

# Anticoagulation in Chronic Hemodialysis: Progress Toward an Optimal Approach

# Differenza fra Pressione Pre-filtro (post-pompa) e Post-filtro (venosa)

↑ Pressione Differenziale

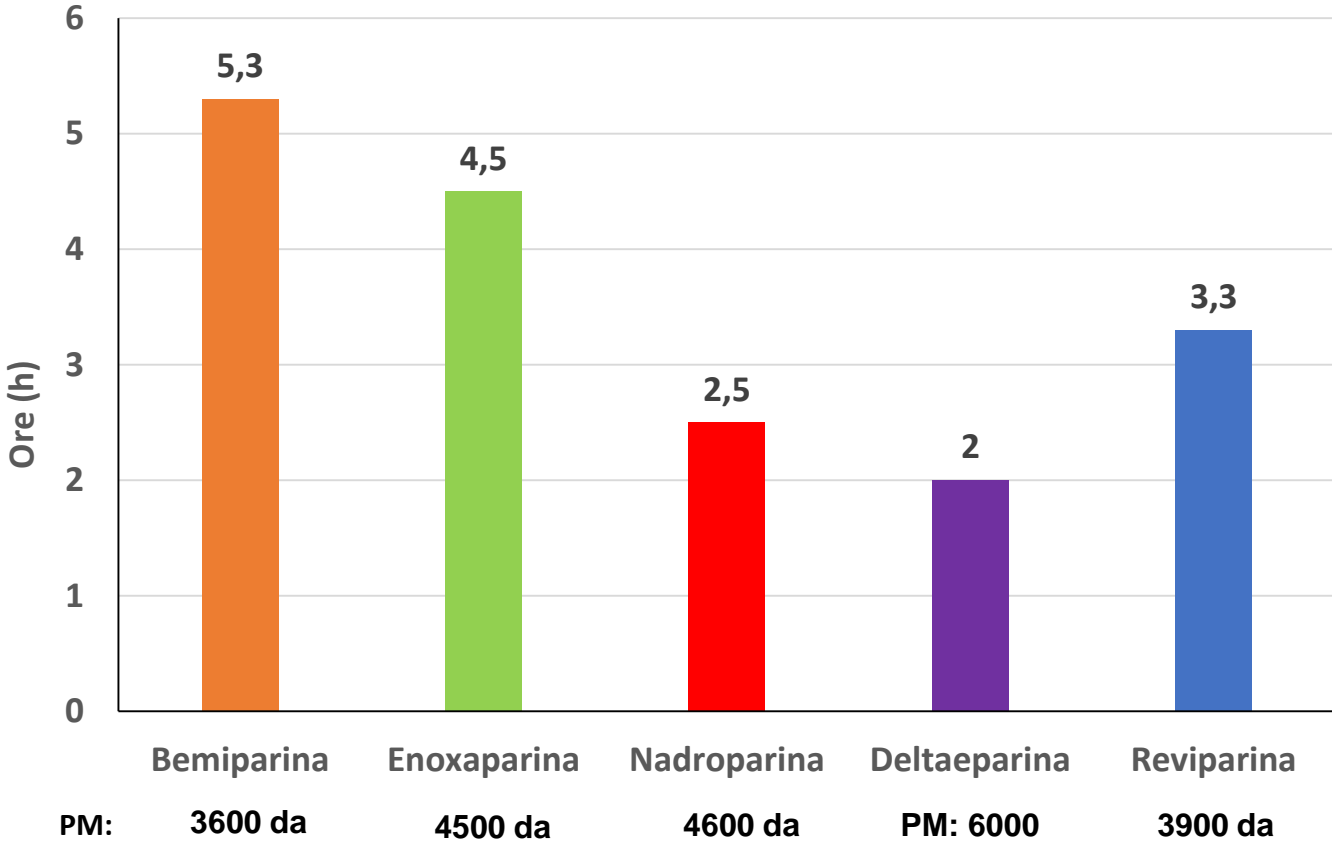

↑ Pressioni Consensuale

↓  
Coagulo nel Filtro

Coagulo nel Pozzetto venoso e/o linea

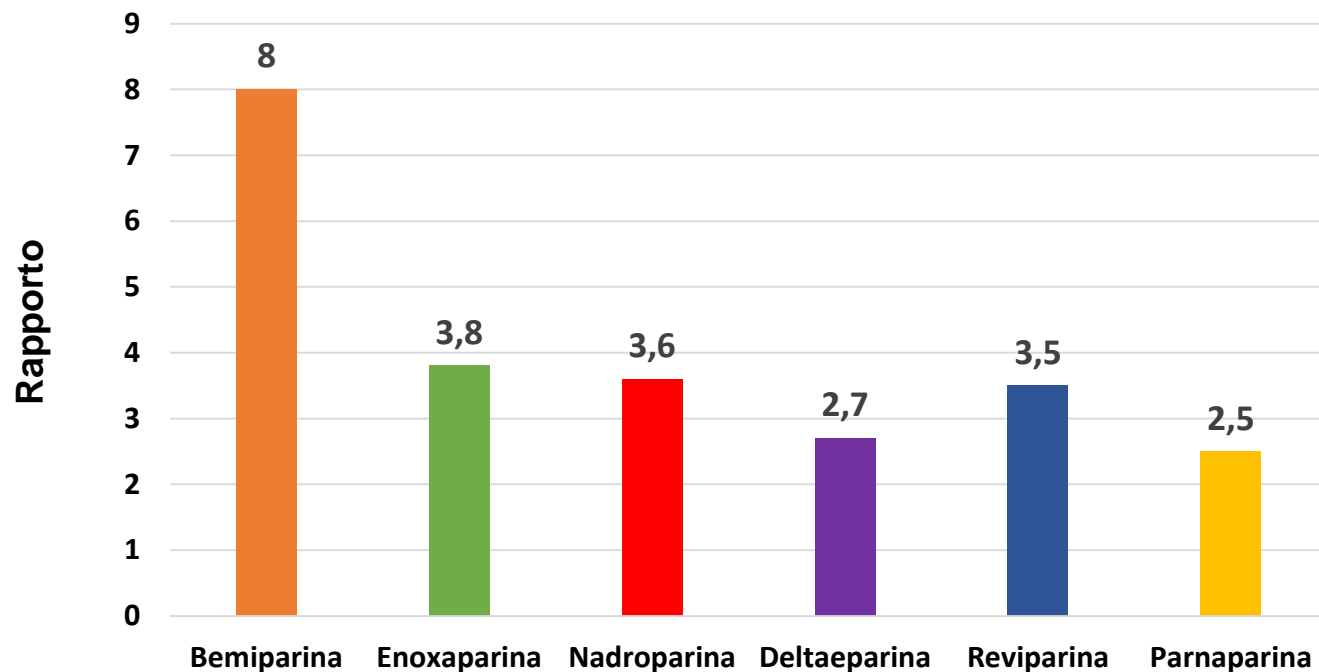

# Distribuzione delle LMWHs in base all'Emivita

# LMWH: Rapporto anti-FXa/anti-FIIa

Le varie eparine a basso peso molecolare sono preparate in base a differenti metodi di depolimerizzazione, per cui differiscono nelle rispettive proprietà farmacocinetiche e anticoagulanti. Per questo motivo non sono interscambiabili clinicamente.

Hirsh J, Chest. 2008;133(6 Suppl):141S-159S

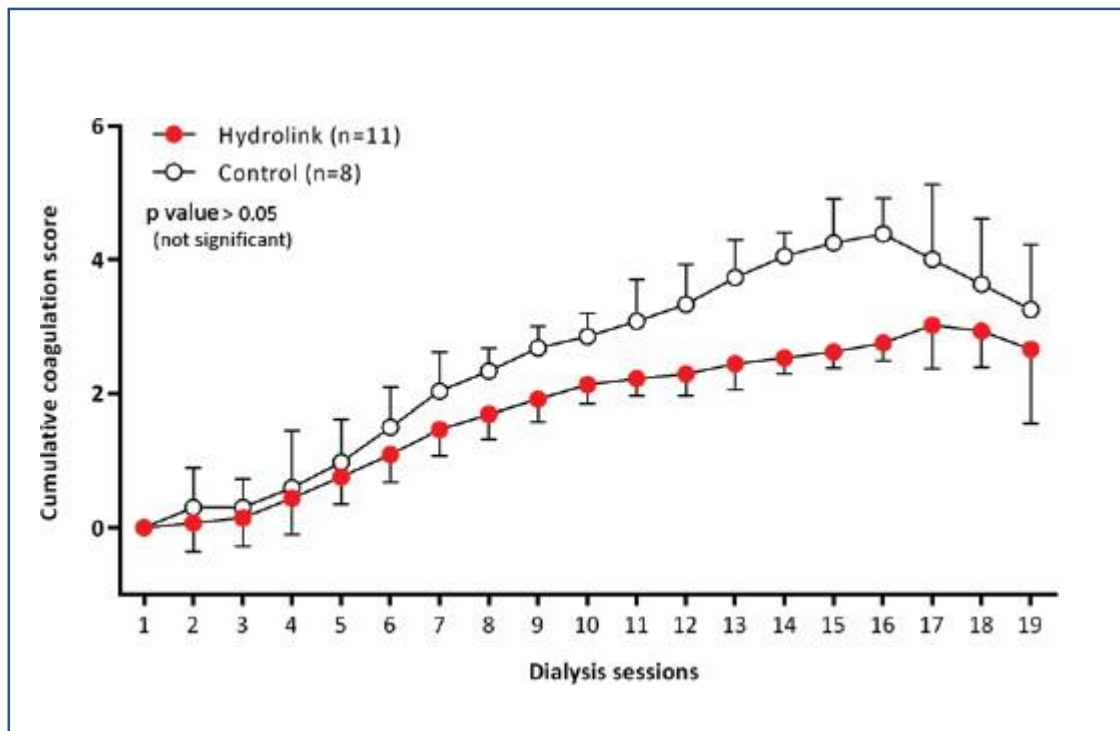

# Prospective, randomized, multicenter, controlled trial (TRIATHRON 1) on a new antithrombogenic dialysis membrane

## CLOTTING SCORES:

- 1 = clean filter;
- 2 = a few blood stripes (less than 5% of the fibers at the surface of dialyzer);
- 3 = many blood stripes (more than 5% of the fibers at the surface of dialyzer);
- 4 = coagulated filter.

## CLOTTING SCORE ADJUSTED FOR HEPARIN DOSAGE:

$\sum((\text{clotting score} - \text{clotting score at baseline}) * \text{heparin percentage})$ .

Heparin dosage	Hydrolink	Control
100 %	Weeks 1-3	Weeks 1-3
80 %	Week 4	Week 4
60 %	Week 5	Week 5
40 %	Week 6	Week 6
20 %	Week 7	Week 7
0%	Week 8	Week 8

# Comparison of the injection of low-molecular weight heparin in the arterial vs. venous blood line for preventing extracorporeal circuit clotting during hemodialysis

When LMWH were first introduced, anti-Xa activity targets were higher than 0.4–0.6 IU/mL,<sup>12</sup> although in current clinical practice lower targets are advisable, 0.2–0.4 IU/mL,<sup>13</sup> particularly in patients with increased risk for haemorrhage.

Davenport A et al. Nephrology 2009

LMWH 40 mg (4000 IU)		OL-HDF (n=12)	MCO-HD (n=13)	HF-HD (=18)	p
Arterial line	Post dialysis AntiXa activity (IU/mL)	0.14 (0.1-0.35)	0.33 (0.1-0.6)	0.32 (0.15-0.49)	0.02
Venous line	Post dialysis AntiXa activity (IU/mL)	0.31 (0.20-0.55)	0.39 (0.21-1.3)	0.4 (0.32-0.67)	NS

LMWH 20 mg (2000 IU)		OL-HDF (n=12)	MCO-HD (n=13)	HF-HD (=18)	p
Arterial line	Post dialysis AntiXa activity (IU/mL)	0.1 (0.1-0.15)	0.1 (0.1-0.17)	0.1 (0.1-0.33)	NS
Venous line	Post dialysis AntiXa activity (IU/mL)	0.1 (0.1-0.14)	0.16 (0.14-0.24)	0.17 (0.1-0.47)	NS

LMWH 20 and 40 mg	Arterial line bolus	Venous line Bolus after 1 week	Venous line Bolus after 1 month	p
Ultrafiltration (L) (n=31)	2.7 (1.4-4)	2.6 (1.5-4)	2.5 (0.6-4)	NS
Substitution volume (L) (n= 12)	19.3 ± 4.5	22 ± 2.9	21 ± 3.5	NS
Manual compression time (min) (n = 12)	7 ± 4	9 ± 3	8 ± 2.9	NS

Coagulation tests 1 week before and after change of administration site		Arterial line bolus	Venous line bolus	p
LMWH 40 mg (4000 IU)	Pre dialysis AntiXa activity (IU/mL)	0.1 (0.1-0.1)	0.1 (0.1-0.1)	NS
	Post dialysis AntiXa activity (IU/mL)	0.29 (0.1-0.6)	0.38 (0.2-1.3)	0.005
LMWH 20 mg (2000 IU)	Pre dialysis AntiXa activity (IU/mL)	0.1(0.1-0.1)	0.1(0.1-0.1)	NS
	Post dialysis AntiXa activity (IU/mL)	0.11(0.1-0.33)	0.16(0.1-0.47)	0.03

# Fouling e Pressione di Transmembrana (TMP)

*In vivo* (patients, n=5): Qb:350 ml/min, Qd:600 ml/min, Qs:85 ml/min

# **L'Anticoagulante Ideale per la Circolazione extracorporea**

- **A Basso costo**
- **Efficiente**
- **Rapidità d'azione ed emivita ridotta**
- **Facilmente somministrabile e monitorabile**
- **Disponibilità di un antagonista**
- **Minimi effetti collaterali**

# Monitoraggio dell'efficacia del trattamento: l'Ispezione visiva

- Presenza di coaguli nelle testate del dializzatore
- Fibre o fasci di fibre coagulati
- Coaguli nel pozzetto e nella linea venosa
- Riempimento rapido di sangue dei tubi di trasduzione
- Sangue refluo nella linea di infusione di eparina

# Tecniche di Anticoagulazione in Dialisi

## UFH

- Boli ripetuti
- Infusione continua
- Combinazione
- Laboratorio: aPTT / ACT
- Antidoto: Protamina

## LMWH

- Bolo singolo
- No monitoraggio
- Emivita maggiore
- Laboratorio: anti Xa
- Antidoto: Protamina
